## BATTERY TERMINAL LAYOUTS

Please use the following as a reference when advising the terminal layout required for your battery.

When determining terminal layout always face the terminal side (terminals closest to you) to avoid confusion / misinterpretation.

Right Hand Positive (RHP)

Left Hand Positive (LHP)

Right Hand Positive (RHP)

Offset 6V

Centrepost

Left Hand Positive (LHP)

## AUTOMOTIVE BATTERY TERMINALS

There are typically three types of terminals on automotive batteries, depending on the type of vehicle, whether it is a car, a truck or a recreational vehicle. Some batteries come with terminals in two different configurations. It's important to ensure you get the right configuration as it may prevent battery cables from reaching.

### SAE TERMINALS

SAE is the standard for most automotive vehicles. Consisting of two lead posts in the shape of truncated cones, positioned on the top of the battery, they have slightly different diameters to ensure correct electrical polarity.

### JIS TERMINALS

The JIS battery terminal is similar to the SAE but smaller. Like the SAE, the positive is larger than the negative, but both are smaller than their SAE counterparts. Most older Japanese cars were fitted with JIS terminals.

### L TERMINALS

L terminals consist of an L-shaped post with a bolt hole through the vertical side. Typically, these are used for batteries in some European cars, motorcycles, lawn and garden devices, snowmobiles and other light duty vehicles.

### MARINE BATTERY TERMINALS

Marine battery terminals typically have dual posts, a 3/8"-16 threaded post for the positive and a 5/16"-18 threaded post for the negative along with a pair of SAE tapered posts
